Metal Roof WindGuard is the total solution for metal roof noise and wind uplift problems. This system acts as external metal purlins to prevent metal panel uplift and roof noise. The key to Metal Roof WindGuard's success is in the patented Windstopper. A non-penetrating stainless steel clamp is placed evenly on each standing seam with 1" x 1" steel bar spanning between the clamps. Windstopper is mechanically attached to the bar over the center of the panel, pressing down on it and preventing uplifting under negative wind pressure. Metal Roof WindGuard can significantly improve wind uplift requirements and reduce noise issues.

Placement in just isolated areas such as chimneys, doorways, vents and partial roof sections is NOT recommended.
